

Every Workout Ends With Dark Matter!

Sports nutrition experts and bodybuilders have long known that the most critical time to stimulate muscle growth through nutritional interfusion is post-workout. They refer to the 1-hour period immediately after training as the “Anabolic Window”. Over the years, supplements have been developed in an attempt to optimize this short muscle building opportunity. While some innovations and developments have been made, researchers concluded that still, NO product on the market was fully optimizing this “window of muscle growth opportunity”. The direct short explanation why is simple. None of these products work fast enough and none of them had the right micronutrient timing at the Anabolic Axis! Now, thought the development of DARK MATTER, bodybuilders are finally maximizing this muscle building opportunity and packing on pounds of new muscle. Victor Martinez credits DARK MATTER for adding 12 pounds of extra muscle to his already monstrous physique.

Active Ingredients:

ProSynthagen: Increases Protein Synthesis Faster Than Whey

Prosynthagen combination of essential free form amino acids that greatly stimulates protein synthesis faster than whey isolate. Prosynthagen’s amino acid matrix is fine-tuned with dual portal transport for faster and greater intestinal uptake by combining free form amino acids with Leucrose™ (a newly developed leucine-alanine dipeptide). This increases anabolic activity regulating protein synthesis and sparing branched chain amino acids giving you the greatest muscle building effects.

Waximax™-C3G: Dramatically Spikes Insulin and Replenishes Glycogen

WaxiMax-C3G is a tri-polymer carbohydrate matrix comprised of osmotic waxy maize starch, Maltoplex-18 and dextrose. This matrix allows for fast gastric emptying, a quick powerful insulin spike and maximum glycogen replenishment. This Tri-polymer elicits the best insulin response opening the anabolic window faster and keeping it open longer. Dark Matter contains a patented concentrated source of C3G (cyanidin-3-glucoside), which improves insulin sensitivity for increased nutrient transport, protein synthesis, creatine/nutrient uptake and glycogen replenishment.

Hydrosized: Multi-phase Creatine Transport & Cell Volumizing Matrix

This complex provides an optimal amount of Creatine in the form of Creatine Pyruvate and Creatine Gluconate to quickly be transported in tandem with peak insulin levels, amino acids and glycogen at the anabolic axis. The inclusion of Microtein (a sustained release creatine) provides a continuous supply of creatine for maximum creatine saturation and cell volumizing.

High Velocity Nano-Physics: New Technology for Rapid Absorption and BioAvailability

Dark Matter has the development of a new type of Nano-technology, called High Velocity Nano-Physics. This technology is based on high velocity particle physics collision of nano-fusible compatible materials. High Velocity Nano-Physics allows for maximum speed, bio-effectiveness and micronutrient timing to open the Anabolic window fast and create a synergistic delivery of Prosynthagen, WaxiMax-C3G and Hydrosized to simultaneously peak at the “Anabolic Axis”
